

DVISION Head-Up Display

With the TILSBERK head-up display, you always keep the focus and your eyes always stay on the path that lies in front of you. The display is mounted in the motorcycle helmet and shows you all relevant driving information quickly, clearly and conveniently directly in your field of vision at a virtual distance of 10m. The display can be individually configured and includes a total of up to ten display elements such as navigation, speed, compass, etc. These display elements can be selected or deselected depending on the chosen basic layout. The head-up display has a very low weight of 44g, lasts a 12-hour day tour when fully charged and can be removed and attached in seconds thanks to the magnetic helmet adapter. No annoying cables are necessary and the crystal-clear display pane can easily be folded away when it is not needed. All parts of the head-up display are located in the helmet, there are no external attachments. The risk of accidents while driving is reduced because you no longer have to choose between safety (looking at the route) and information (looking at the speedometer, navigation system, etc.). The information display is designed in one color for good readability and few distractions and the brightness of the display adapts to the lighting conditions of the environment, so that it is easy to see anywhere.
