

Aerodynamic wheel covers

These wheel covers improve the aerodynamics of the motorcycle considerably, since the airflow at the front wheel has less turbulence and can flow better to the parts behind it. This reduces air resistance and also provides the cooler with an optimal air supply. The front wheel must be removed to install the wheel covers - the brackets required for installation are included in the scope of delivery. In order to achieve an optimal aerodynamic result, we also recommend installing the carbon fender with integrated air ducts (item number KVO.006.M123S.K).
