

## Batteries

Gel battery "Bike Power" or "Landport" in order to provide enough power for the start and all other consumer circuits. Developed for the highest requirements! All batteries have to be charged before first use.

The energy taken from a battery must be replenished immediately. Batteries begin to sulfate (destruct themselves) at 12.4 volts. If you drive little, please check the battery every 6 weeks and be sure to recharge it from 12.5 volts - otherwise there is a risk of loss of performance and a significantly reduced service life! Connect seasonal vehicles to a suitable trickle charger!

Attention: The battery guard wire of the original lithium battery of the BMW R1300GS & Adventure must be closed with a dummy plug (see article 7678400)! The red arrow in picture 2 shows where the plug must be inserted for this.
